

Provisional Patent Draft: System and Method for Reporting and Fetching Fraud Information and Agreement Registration Using Government-Approved Unique Identifiers

Abstract

The invention discloses a secure online portal for reporting, retrieving, and preventing fraudulent activities carried out by individuals or entities in daily life. The system requires all fraud reports and agreements to be linked to a government-approved unique identifier (such as Aadhaar, PAN, Passport, or Driving License). A verification engine validates identifiers via authorized APIs, registration agreement, legal documents before storage or publication. The system further allows parties to register mutual agreements with digital signatures, which may later serve as evidence in fraud reports. Fraud information can be publicly searched by UID with privacy safeguards, making the invention preventive in nature and distinct from police-based reactive systems.

1. Field of the Invention

The present invention relates to systems and methods for preventing fraud and resolving disputes. Specifically, it relates to an online platform that enables users to report fraudulent individuals, groups, or entities using government-approved unique identifiers (UIDs) and also register mutual agreements between parties to serve as potential evidence.

2. Background of the Invention

Fraud, cheating, and scams are frequent occurrences in daily routine life, such as borrowing money without repayment, theft of items, breach of trust in business dealings, or deception in personal relationships. Existing fraud reporting systems, such as police FIR mechanisms, are reactive in nature and are primarily designed for criminal investigation and prosecution. These systems are internal to law enforcement, are not publicly searchable, and lack preventive or agreement-based documentation mechanisms.

Victims of fraud frequently face difficulties in proving fraudulent intent when no formal or verifiable agreement exists. Current private fraud databases are often unreliable, unverifiable, and prone to misuse. While fraud reporting mechanisms exist in police stations, they are fundamentally different from the present invention. Police systems do not allow common citizens or businesses to independently verify fraud history before engaging with an individual, and they provide no method for pre-registering agreements or promises between parties.

The present invention addresses these problems by providing a unified, preventive platform where users can both report fraud and pre-register agreements using verified UIDs. By enabling UID-based fraud history retrieval, the system acts as a preventive shield for individuals and businesses, helping them make informed decisions before associations.

3. Summary of the Invention

The invention provides a secure, verified, and **legally admissible method** for fraud reporting, fraud history retrieval, and agreement registration. The system requires that all reports and agreements be linked to a government-approved UID such as Aadhaar, PAN, Passport, Driving License, or other official identifiers. UID validation is performed via official or authorized APIs before acceptance.

Fraud information can be reported, stored, and later fetched **through UID-based search**. Parties can digitally sign and register agreements with secure timestamps, which can be linked to fraud reports as evidence in disputes. Unlike existing police systems, this invention is preventive, transparent, and publicly accessible, thereby reducing fraudulent associations in daily life.

4. Detailed Description of the Invention

The system comprises the following modules:

1. User Registration & Authentication Module – enables individuals to create accounts linked with a verified government UID.
2. Fraud Reporting Module – allows users to report fraudulent activities against individuals or entities using their government-approved UID.
3. Agreement Registration Module – enables two or more parties to register agreements, digitally sign them, and store them securely with timestamps.
4. Verification Engine – validates all UIDs via official government or authorized third-party APIs.
5. Evidence Linking Module – links agreements to fraud reports if disputes occur.
6. Public Search Module – enables the public to search fraud history using government-approved UIDs, with privacy safeguards to protect personal details.
7. Data Security & Compliance Layer – ensures encryption, privacy protection, tamper-proof storage (with optional blockchain-based timestamping), and legal compliance.

5. Claims

1. A fraud reporting system wherein all reports must be linked to a government-approved unique identifier and verified before publication.
2. A system for fetching fraud history by UID, with privacy safeguards and controlled access.
3. An agreement registration module that enables parties to digitally sign and store agreements linked with verified UIDs.
4. A method of linking pre-registered agreements as evidence in fraud reports.
5. Integration of UID verification via official government APIs or authorized validation services.
6. A secure storage mechanism using encryption, timestamps, and tamper-proof digital records.
7. A preventive fraud management method that allows individuals or businesses to check fraud history before entering into financial, social, or professional associations.

6. Legal and Compliance Safeguards

The system includes the following safeguards to ensure legal compliance and risk mitigation:

- Defamation Mitigation: Reports are only accepted after UID verification, minimizing false or malicious claims. Reporters are to accept the terms and condition before submission of post.
- Privacy Protection: Public access is restricted to fraud summaries; sensitive personal details remain hidden. Data will be masked wherever required.
- Data Protection Compliance: The system adheres to India's Digital Personal Data Protection Act (DPDP 2023), the IT Act, and other applicable laws.
- Consent Mechanism: Reporters and parties explicitly consent before data is stored, processed, or disclosed.
- Tamper-Proof Evidence: Agreements and reports are stored with digital signatures and timestamps, ensuring evidentiary reliability.
- Transparency and Accountability: A case UID is generated for every report, enabling traceability and structured retrieval.
